AnyWARE Inc. Partners with Award-Winning ShoreTel™ to Bring Next-Generation VoIP Solutions to Central Texas

AnyWARE Inc., an Austin-based telecommunications integrator, today announced it is partnering with ShoreTel Inc., the leader in enterprise IP telephony, to provide what PC Magazine dubbed “Best of the Year” next-generation voice and data systems.

ShoreTel selected AnyWARE as its Austin-based distributor to provide commercial and government organizations with its award-winning ShoreTel IP PBX platform.

“We are delighted to welcome AnyWARE to the ShoreTel team,” said Steve Timmerman, ShoreTel’s Vice President of Marketing. “Unlike traditional phone systems, IP voice is extremely flexible and provides endless opportunities for customization and adding value.

“However, this requires intimate knowledge of specific customer needs,” he said. “AnyWARE is not merely installing our products, but also elevating the business phone system from a taken-for-granted utility to a productivity-boosting environment.”

AnyWARE’s specialists provide all components of an enterprise-wide communications system. They use ShoreTel’s award-winning ShoreTel IP PBX platform to create cost-effective business phone systems.

ShoreTel’s enterprise-level IP telephony system provides numerous benefits to companies, including: allowing staff to remain a part of their enterprise’s network from any location; easy-to-use reconfiguration options when new lines need to be added or dropped; and voicemail/email convergence.

“ShoreTel’s VoIP technology offers businesses of all sizes and geographic configurations a flexible, reliable telephony system. We were selected for our extensive experience in IP technology and are excited to be offering the most robust IP product available,” said Gary Lubbering, AnyWARE’s Vice President of Business Development.

IP voice systems reduce voice signals to standard Internet Protocol data packets, so conversations can run over data networks. The applications bundled into ShoreTel’s enterprise-class phone system include advanced mobility features, voicemail, automated attendant, automatic call distribution, call detail recording, unified messaging, and desktop call control. Everything is accessed from the same

intuitive Windows-based interface, making the system very easy to use and manage.
